

Technical Position

Leigh Cables are seeking a person to be trained in a technical support role specialising in cable manufacturing, material properties, electrical and fire performance as well as the physical attributes of cable design.

Referencing industry standards and specification documents, a technical person at Leigh Cables will eventually be able to confidently advise on cable design and suitability for any given application, organise testing, documentation, certification and be able to visualise the concept of an industrial cable that performs according to a customer's requirement. Pride in the safety, quality and performance of our product will be the primary foundations of the position.

We are looking for an enthusiastic person keen to learn new skills amidst a busy working environment, able to apply initiative to improve their own skill sets in quieter times or when left to work alone.

Ideal characteristics would include a thirst for learning and understanding technical details with an eye for detail, good practical skills and logical thinking. We encourage new thinking and suggestions.

Training in this role is considered a long term process due to the depth of knowledge required, but will be adjusted to suit the applicant's experience.

Skills

- Good communication skills and literacy
- A good grasp of math, basic sciences, physics or a technical engineering background would be an advantage.
- Competent operation of Microsoft Windows based computers including Microsoft Office applications including Word and Excel
- Ability to visualise and absorb technical information and applications

Experience

- We are open to candidates of various experience levels with the above characteristics with the expectation to train to the required competency.
